ASSIGNMENT 11
Final UI Design Document

Project 01B: Finding the Next Best Step

Team DSIders

Design for Social Innovation

---

1 Introduction

This report presents the final user interface for our project, a tool that helps a student who already knows what they want to become find out what to do next. In Sprint 1 we described the idea: the student says what they want to become, answers a few short questions, and receives one concrete step. This report shows the screens that carry that idea and explains the reasoning behind each one.

The screens were designed for a shared, budget Android phone. There are two paths: one for the student and one for the caseworker who supports them. The design builds on the Sprint 1 submission, and the engine behind it (intake parser, question picker, gap reasoner and confidence gate) is unchanged. The clickable prototype is on Figma:

https://www.figma.com/design/9K2MGda8rKSc7ZYwwkkB81/Untitled?node-id=0-1&p=f&t=PYJnIZwnkmY4PRez-0

2 Design Approach

Four ideas guided every screen.

1. **One thing at a time.** A question screen asks one question, and the next-step screen shows one action. Long forms and long lists were the main reason students stalled in our earlier research.
2. **A gap is a task, not a rejection.** When something is missing, such as a resume, the screen says how long it takes and where to get help. Nothing in the product is shown in red.
3. **Show the reason.** Every question and every result carries a short explanation, so the student can check it and the caseworker can correct it.
4. **Hand over rather than guess.** If the system is unsure, it offers a named person instead of giving a confident answer that may be wrong.

3 Visual Style

Both paths share one visual style. The page is a warm off-white with white cards and navy text. A single orange is kept for the main action on each screen, so the student always knows what to tap next. Colour also marks status, but always together with a written label, so meaning never depends on colour alone.

Colour	Meaning
Navy	Text, active navigation, selected filters
Orange (filled)	The main action on a screen
Green	Already have, done, available
Amber	Missing, needs attention
Grey	Later, not urgent

Each path has its own bottom navigation bar. The student bar has four items (Home, My path, Help, Profile) and the caseworker bar has three (Students, Requests, Profile). Buttons are full-width rows that are easy to press with a thumb, and navigation items carry text as well as icons.

4 How a Student Moves Through the App

Figure 1 shows the route through the student screens. The student states a goal, the system reads it back and asks a few questions, and the result is a single next step. If the system is not confident, it offers a caseworker. When the student marks a step as done, the system runs again with one more fact known, so the next answer is different.

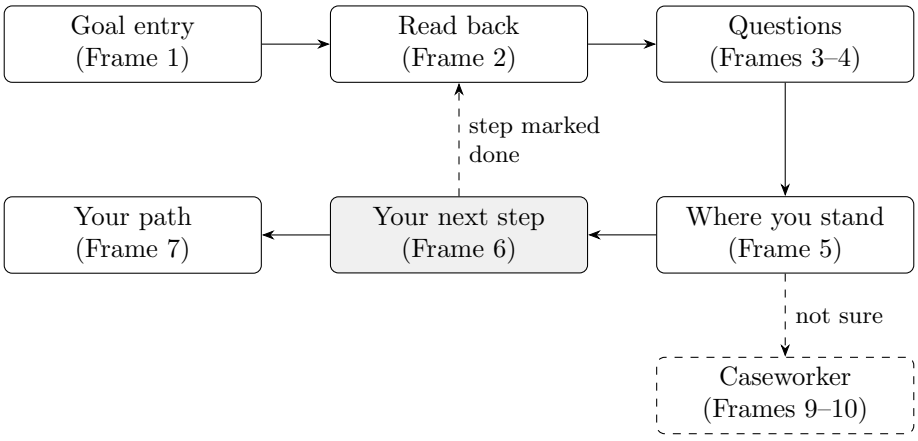

Figure 1: Student route through the app. The shaded box is the goal of the whole flow. Dashed lines show the handover and the loop after a step is completed.

For example, Priya types that she wants to become a data analyst but does not know where to start. The app reads this back to her, asks what kind of work she pictures and whether she has a resume, and then tells her that she already has spreadsheet basics, is missing a resume and basic SQL, and can leave other things for later. Her next step is to write her first resume, which takes about two hours, and the screen tells her what to bring and where a clinic is held on Saturday.

5 Account Screens (Frames 0 and 0b)

Two screens come before the student path, a log-in screen (Frame 0) and a create-account screen (Frame 0b). We have not reproduced them in this report because they are ordinary sign-in screens, but both are in the Figma prototype ahead of Frame 1.

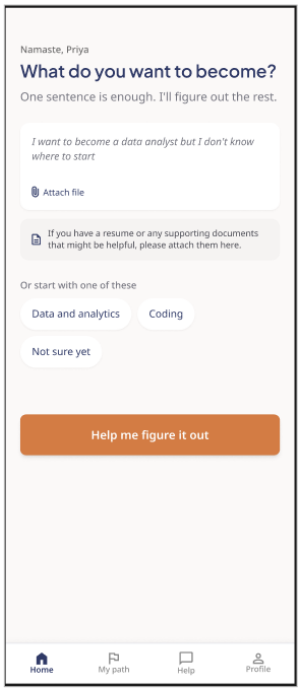

Frame 0, Log in. The screen greets the user with “Welcome back” and has a switch at the top to choose *Student* or *Caseworker*. Below it are a field for username or ID, a password field with

a show and hide icon, a "Forgot password?" link and one orange *Log in* button. A link at the bottom takes new users to account creation.

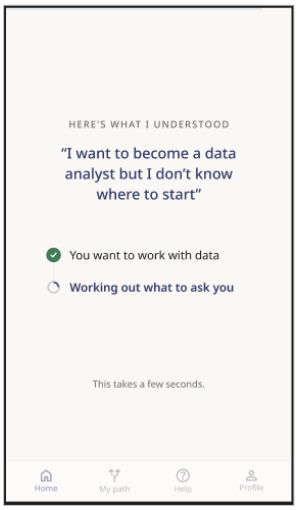

Frame 0b, Create account. The screen says it takes about a minute and that any detail can be changed later. The user first chooses *I am a* Student or Caseworker, then enters a full name, a username, a password and a confirmation of the password, with a note that the password needs at least eight characters. The user must tick a box agreeing to the terms and privacy policy before pressing *Create account*. A link at the bottom returns existing users to the log-in screen.

Sprint 1 listed login as out of scope. These two screens add the smallest version of it that the rest of the design needs. Choosing a role at the start sends each person to their own path with its own navigation bar. The account also holds the name that the app uses in its greeting ("Namaste, Priya") and on the profile screen, and it lets a caseworker be a named, identifiable person when a student asks for help.

6 Student Screens (Frames 1–8)

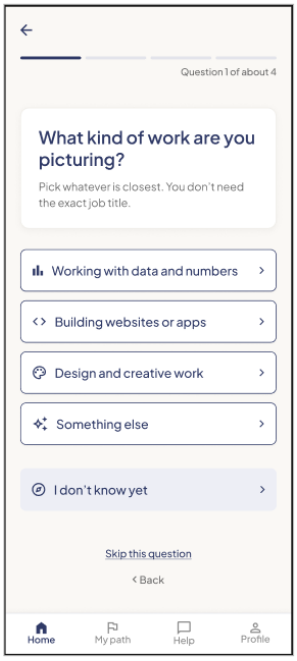

Frame 1: Goal entry
What it shows. One free-text box with the prompt "One sentence is enough", an optional file attach for a resume, three starter chips (Data and analytics, Coding, Not sure yet) and one button.
Why it is built this way. Students can usually say what they want but cannot break it into steps, so the screen asks only for the goal in their own words. There is no form and no jargon, and "Not sure yet" is an acceptable way to begin.

Frame 2: Reading it back

What it shows. The student's own sentence repeated back, a tick beside "You want to work with data", and a progress note that says "Working out what to ask you".

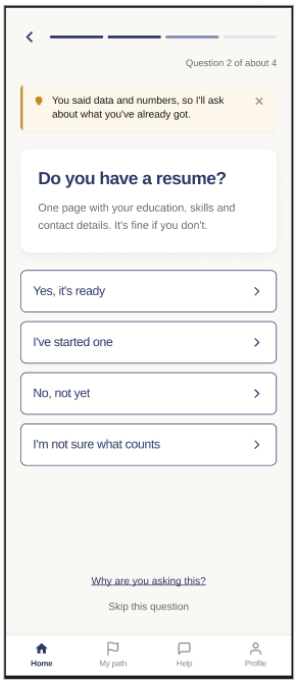

Why it is built this way. It shows that the sentence was understood and not just matched to keywords. It also gives visible progress while a slow connection does its work.

Frame 3: First question

What it shows. "Question 1 of about 4", one question about the kind of work the student pictures, four tappable answers and a separate "I don't know yet" option, with links to skip or go back.

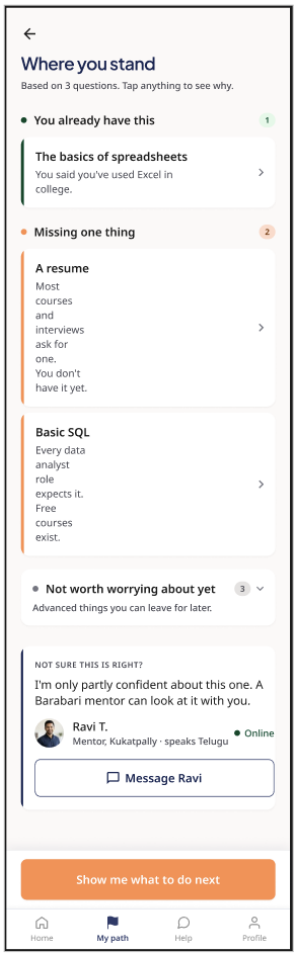

Why it is built this way. Nothing else can be judged until the field of work is known, so this is asked first. The word "about" is honest because the system may stop early. "I don't know yet" is treated as a real answer and not as a failure.

Frame 4: Follow-up question

What it shows. A short banner explaining the question ("You said data and numbers, so I'll ask about what you've already got"), the question "Do you have a resume?", four graded answers and a "Why are you asking this?" link.

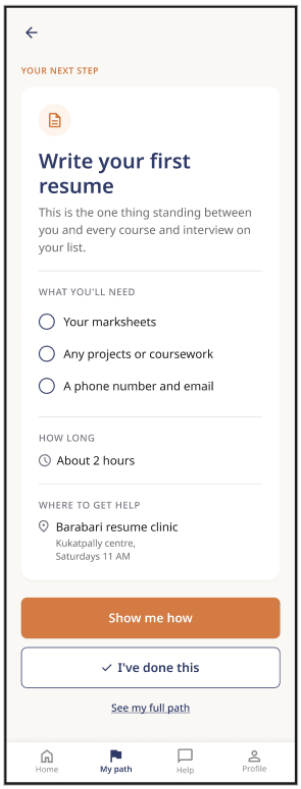

Why it is built this way. The banner tells the student why this question follows the last one, so the sequence does not feel random. Graded answers such as "I'm not sure what counts" help a student who does not yet know what a resume is.

Frame 5: Where you stand

What it shows. Results in three groups, each with a reason: *You already have this*, *Missing one thing* and a collapsed *Not worth worrying about yet*. When the system is only partly sure, a card offers a named mentor, Ravi T., who is online and speaks Telugu.

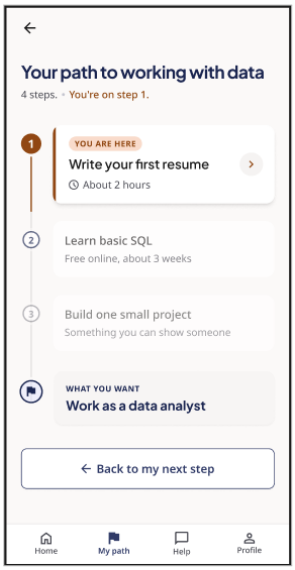

Why it is built this way. A ranked list asks the student to trust its order, whereas a reason lets them check it and tell us if it is wrong. Missing items use a neutral amber label, and advanced items are collapsed so that they do not overwhelm. The mentor card is where the handover to a person happens.

Frame 6: Your next step

What it shows. One action, "Write your first resume", with a checklist of what to bring, how long it takes (about two hours) and where to get help (a resume clinic on Saturday). The student can choose *Show me how*, *I've done this* or *See my full path.*

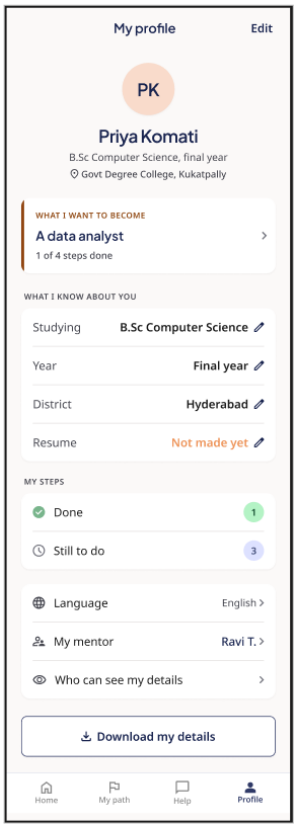

Why it is built this way. This screen carries our main claim, that one clear action is more useful than a complete list. A missing resume becomes two hours of work and not a rejection. Pressing "I've done this" sends the student back through the system, which then gives a new answer.

Frame 7: Your path

What it shows. Four steps with the current one marked "You are here", later steps shown faded, and the final goal pinned at the bottom.

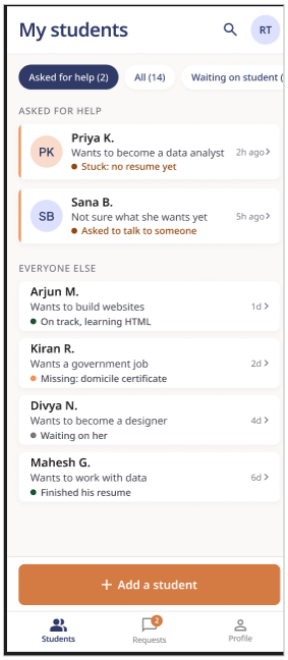

Why it is built this way. The student should know where the step leads without feeling the whole distance at once, so only the current step is emphasised.

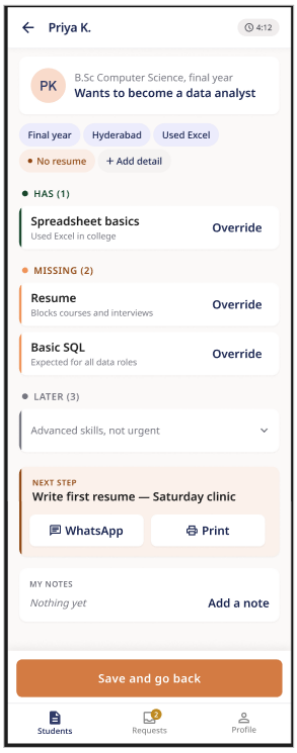

Frame 8: My profile
What it shows. The student's name and college, progress towards the goal, a list of everything the system knows (each row editable), settings for language, mentor and privacy, and a button to download personal details.
Why it is built this way. Students can see and correct everything held about them, and correcting a wrong detail is the quickest way to correct a wrong recommendation.

7 Caseworker Screens (Frames 9–11)

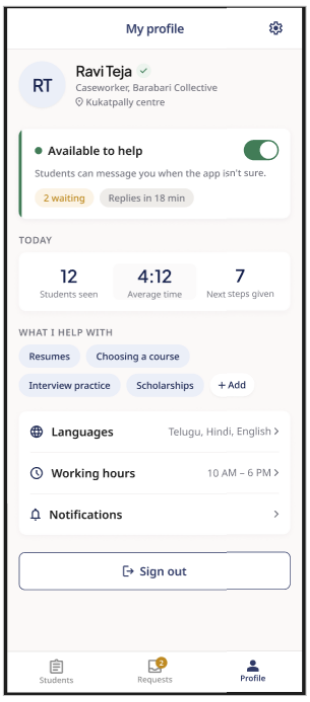

The caseworker screens are denser than the student screens, and they always allow the caseworker to overrule the system. All names and numbers shown are sample data.

Frame 9: My students
What it shows. A list of students with filters at the top. Students who asked for help appear first, each with a one-line reason, and the rest follow below. The Requests tab carries a badge for new requests.
Why it is built this way. A handover from Frame 5 must appear where the caseworker looks first. The one-line reason lets them decide whom to open without opening every student.

Frame 10: Student detail
What it shows. The student's goal and known facts, the same three groups seen in Frame 5 in compact form, an *Override* button on every row, the next step with *WhatsApp* and *Print* buttons, and a place for notes.
Why it is built this way. The caseworker sees the same reasoning as the student and can correct it row by row. WhatsApp and Print exist because many students will not carry the app home, and the next step has to leave the screen as something they can follow.

Frame 11: Caseworker profile
What it shows. An *Available to help* switch, the number of students waiting, a summary of the day, the topics and languages the caseworker helps with, working hours, notifications and sign out.
Why it is built this way. The switch keeps the offer in Frame 5 honest, because a student is only shown a mentor who is actually available. Languages and topics allow the app to say "speaks Telugu" and to match a person to a problem.

8 Conclusion

The final design turns a stated goal into one clear next step in a small number of taps. It treats missing items as tasks, gives a reason for every result, and passes the student to a named person when the system is not sure. The screens are ready to be reviewed by caseworkers before the design is connected to the engine.
