Project 01B: Finding the Next Best Step

1. **Which is your chosen NGO of focus? & Who is your primary user?**

- **Chosen NGO:** Nirmaan, Barabari Collective, or Umeed for Women.
- **Primary User:** An individual seeking support (e.g., social services, career guidance, women's support) who has a stated need or goal but lacks complete information on how to achieve it.

2. Specific Problem Statement: A person seeking social support needs to navigate from a stated need or goal to an appropriate next action in a landscape of fragmented programmes, organisations, and sources, but is unable to identify what specific information is still missing to determine their eligibility, resulting in struggling to identify what support exists or what they should do next.

3. What does the user's current workflow look like?

- **Need Identification:** The user realizes they need help and attempts to find support options.
- **Fragmented Discovery:** They encounter scattered, disconnected information across various platforms.
- **Eligibility Uncertainty:** They struggle to figure out if they are actually eligible based on their current circumstances.
- **Process Stagnation:** They get stuck because they do not know what specific details, documents, or next steps are required to proceed, often leaving their search unresolved.

4. What must the solution enable the user to do better?

- **Conversational Information Gathering:** Interactively identify and collect the missing information required from the user's profile.

- **Eligibility Reasoning:** Evaluate the user's incomplete profile against specific scheme rules to determine potential matches.
- **Recommendation & Ranking:** Clearly outline and prioritize the appropriate next best actions for the user to take.

5. What are the constraints under which your solution has to operate under?

- **Data Sourcing:** The solution must rely on designated starting data sources like myScheme and OGD Platform India.
- **Operational Scope:** Any recommendations provided by the system must be treated strictly as a benchmark, not as proof of real-world suitability.

6. How will you demonstrate that your solution addresses the problem?

- **Synthetic Profile Evaluation:** Generating synthetic needs and incomplete user profiles to demonstrate that the system can successfully identify the missing information, gather it interactively, and accurately output the expected next actions based on the scheme rules.
